About TopLine

TopLine manufactures PID Particle Impact Dampers for PCB printed circuit board assemblies under an exclusive technology transfer license from NASA and other patents granted.

How PID works

PID technology reduces vibration and increases reliability in circuit board assemblies. The **PID** Particle Impact Damper is a sealed container that is filled to 90% with tungsten (W) balls. The impact of tungsten balls colliding in the **PID** dampens fundamental frequency f_o mode vibrations in the PCB assembly. This maximizes energy transfer to the **PID** which dampens the vibration. The weight of the moving particles inside the **PID** is approximately 10% the mass of the PCB assembly. The motion of the particles (tungsten balls) in the sealed PID housing removes vibratory energy from non-linear vibro-acoustic environments such as PCB card assemblies. The PID straightens the PCB at the central lobe and attenuates vibration by pushing or pulling the PCB in the opposite direction after the tungsten balls overcome gravity.

Tungsten Material Properties

Tungsten (W) is environmentally friendly. Tungsten's properties include high density and tensile strength.

- Atomic Number 74
- Density 19.3g/cc (@20°C)
- Linear CTE 4.3 ppm/°C
- Poisson's Ratio 0.284
- Melting Point 3400°C
- Tensile Strength 700~3400 MPa @25°C

Where to Mount on PCB

Vibration is attenuated by mounting the **PID** near the geometric center (anti-node) of the PCB. The damping effect increases reliability in the PCB. The **PID** may be located on either side of the board. Alternatively, **PID** may be elevated to bridge and avoid interference (straddle) existing components on the board.

Vibration Frequency

Vibration at the fundamental frequency f_o causes bending, fatigue and cracks in the PCB assembly. Excessive vibration from external excitations leads to catastrophic failure. Typical fundamental vibration frequency ranges from 100Hz to 2000Hz.

Patents & Trademarks

TopLine holds 5 U.S. Patents in the field of Vibration Damping.

U.S. Patent	Description	Granted
9,521,753	Original NASA Circuit card assembly	2016
10,041,558	Tunable PID	2018
10,021,779	Quick Response	2018
D842351	Toroidal Shape PID	2019
10,704,639	Unidirectional PID	2020

Inspired by Gravity®

Electrical Power and Temperature

- No electrical power is needed.
- Operating temperature -55°C to +175°C without derating.

How to Select the Correct PID

Step 1. Tungsten payload should be approximately 10% of the mass of your PCB assembly (PCA/PWA).

Step 2. Attach the PID near the geometric center of the board. Or, locate where the board is oscillating the most.

Step 3. Select mounting style. For most boards, it is best to attach the PID to the board with strong adhesive glue. Optional PID models can be attached with screws.

Step 4. select the physical package size that fits the space available on your board. Multiple PIDs can be distributed across your board where room permits.

Toroidal Shape PID Particle Impact Damper

U.S. Patent D842,351

Description: Toroidal PID has a through hole in the center.

Application: A rotating motor shaft or cables can safely extend through the damper.

Construction: Tungsten particles are in a sealed chamber inside the housing.
Housing is typically constructed of FR4, although other housing materials are available.

How it works: Similarly with standard PID, particles inside the chamber escape gravity when highly excited by a massive random vibration. The particles collide against the inside walls of the chamber, lifting or pushing the PC Board into position to mitigate damage to components mounted on the surface of the board.

Fundamental frequency f_o 100Hz to 2000Hz Broadband.

Board mass: 10g to 1000g

Quick Response PID Particle Impact Damper

U.S. Patent 10,021,779

Description: Particles are separately sealed inside individual spherical cavities. Particles are unencumbered and can quickly move upon the onset of massive random vibration.

Application: Planar surfaces such as a PCB which require more sensitivity and quicker response to random massive vibrations.

Construction: Tungsten particles are in a sealed chamber inside the housing. Housing is typically constructed of FR4, although other housing materials are available. Layers are honeycomb and stackable inside the housing.

How it works: Particles are unencumbered and can quickly move upon the onset of vibration. Particles escape gravity when highly excited by a massive random vibration. The particles collide against the inside walls of the chamber, lifting or pushing the PC Board into position to mitigate damage to components mounted on the surface of the board.

Fundamental frequency f_o 100Hz to 2000Hz Broadband.

Board mass: 10g to 1000g

Unidirectional PID Particle Impact Damper

U.S. Patent 10,704,639

Description: Rod shaped particles are sealed inside individual cylindrical cavities. The particles travel in one (unidirectional) direction upon the onset of massive random vibration.

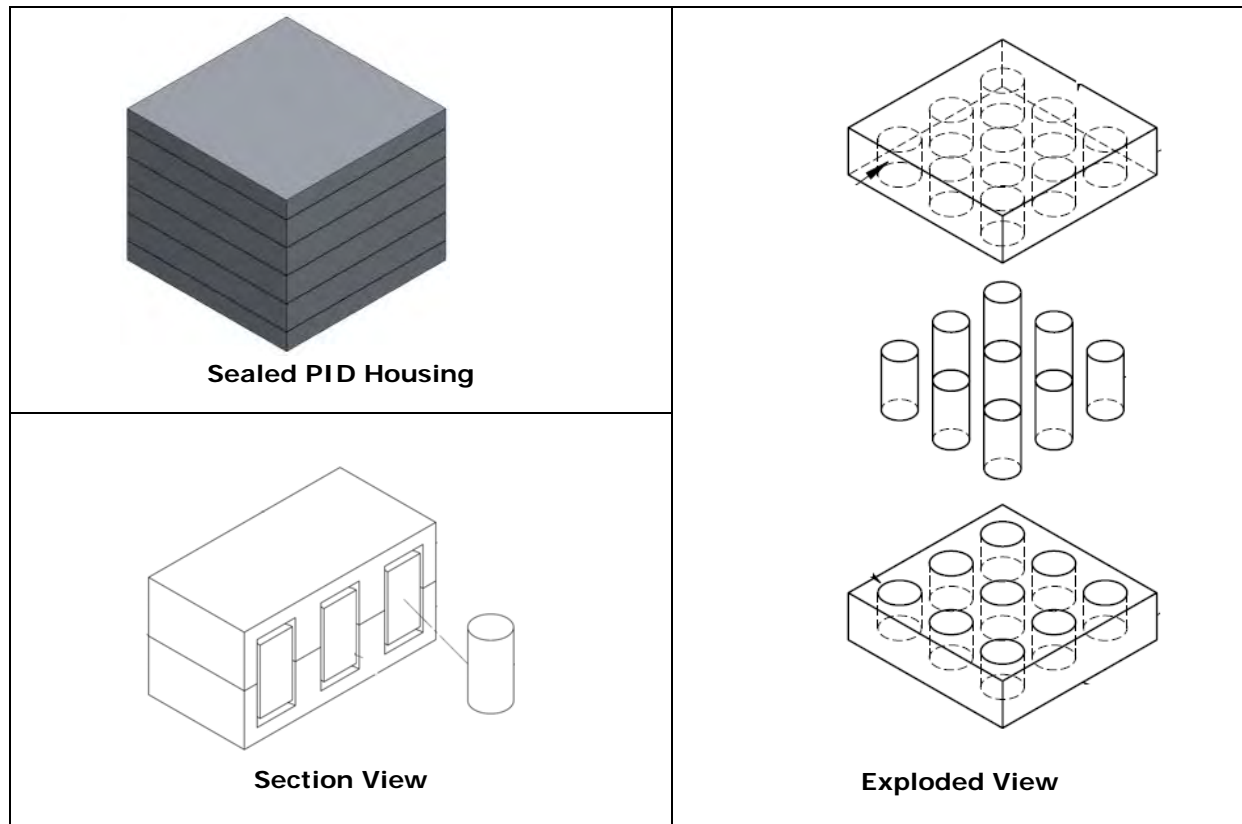

Application: Dampens planar surfaces such a PC Boards, floors, walls or glass windows.

Construction: Tungsten particles in a sealed cylindrical chamber inside the housing. Housing is typically constructed of FR4, although other housing materials are available.

How it works: Particles quickly move unidirectionally back and forth in one plane upon the onset of vibration. Particles escape gravity when highly excited by a massive random vibration. The particles collide against the floor and ceiling of the cylindrical chamber, lifting or pushing the PC Board or planar surface into position to mitigate damage to components mounted on the surface of the board.

Fundamental frequency f_o 100Hz to 2000Hz Broadband.

Board mass: 10g to 1000g

PID mounted on PCB

See NASA Video showing how PID mitigates destructive vibration on a PC Board.

<https://www.youtube.com/watch?v=P4SQuBaKXWw>

About the Video:

Video shows a destructive life test performed on NASA Marshall Space Flight Center printed circuit card assemblies 4" x 7" (10 x 18cm) 0.090-inch (2.3mm) thick. Four 21mm x 21mm daisy-chained 400L CCGA column grid array components are mounted on each card. One card was left undamped. A PID damper was glued at the center of the second card. The cards were mounted side by side onto a vibration table and subjected to excessive vibrations. 19 channels on the undamped boards (without PID) failed within 12 minutes. By comparison, 19 channels on the damped boards (with PID) survived 5 hours (306 minutes) before ultimately failing.
